1. What is HTML?

HTML is the standard language used to create and structure web pages. It provides the basic building blocks of a website by defining elements such as headings, paragraphs, images, links, lists, tables, and multimedia content. HTML does not control the appearance of a webpage; instead, it focuses on structuring content so that browsers can display it correctly. Styling is typically handled by CSS, while interactivity is provided by JavaScript.

HTML is an essential technology in web development because every webpage displayed in a browser is built upon an HTML document. It allows developers to organize information logically and create content that is accessible and easy to navigate.

Figure 1: HTML Demonstration Webpage

For my HTML demonstration, I created a webpage about the video game Dark Souls III. The aim of this example was to show how HTML can be used to organize different types of content into a clear and readable webpage. The page focuses mainly on structure rather than styling or interactivity, which makes it suitable for demonstrating core HTML skills.

2.1 How the Webpage Works and What It Demonstrates

The webpage provides information about Dark Souls III using headings, paragraphs, images, an embedded YouTube trailer, lists, tables, and hyperlinks. It demonstrates how HTML can be used to organise and present different types of content within a single webpage. The example shows how standard HTML elements can work together to create a clear, informative, and easy-to-navigate webpage without relying on CSS or JavaScript.

2.2 Features Implemented

Features Implemented in the Webpage:

- The main heading is used to clearly identify the page topic.
- Images are used to display the game cover art and visual content.
- An embedded YouTube trailer is included using an iframe element.
- Paragraphs are used to describe the game, gameplay and background information.
- Unordered and ordered lists are used to organise game details and features.
- Tables are used to present minimum and recommended system requirements.
- Hyperlinks are used to direct users to the official website and community wiki.
- Horizontal rules are used to separate the webpage into clear sections.
- A footer is included at the bottom of the page to provide page information.

2.3 HTML Elements Used

The following HTML elements were used throughout the webpage:

- `<h1>` to `<h4>` – Used to create headings and organise content into sections.
- `<p>` – Used for descriptive text and game information.
- `<img>` – Displays the cover art and gameplay screenshots.
- `<iframe>` – Embeds a YouTube video directly into the webpage.
- `<ul>` – Creates unordered lists for game information and useful links.
- `<ol>` – Creates an ordered list for gameplay features.
- `<table>` – Displays system requirements in a structured tabular format.
- `<a>` – Creates hyperlinks to external websites.
- `<hr>` – Separates sections visually.
- `<footer>` – Provides information at the bottom of the page.

2.4 Reflection

Through this project, I gained practical experience using a variety of HTML elements to structure and organise webpage content. I learned how different elements such as headings, images, tables, lists, and hyperlinks work together to create a complete and informative webpage. This activity improved my understanding of how HTML forms the foundation of web development.
